Datazoic Agentic Platform

Platform User & Administrator Operational Manual

1. Platform Overview & Getting Started

The Datazoic Agentic Platform is an enterprise-grade API orchestration environment. It provides role-based access for both standard users and platform administrators through a modern, responsive web portal.

- **Web Portal URL:** http://localhost:8501
- **Backend API Probe:** http://127.0.0.1:8000/health
- **Default Administrator Account:** admin@examplemail.com (Password: admin@123)
- **Default Standard User Account:** user@examplemail.com (Password: user@123)

2. Screen 1: Agent Chat & Multi-Step Assistant

The primary chat screen allows users to interact with the 10-stage LangGraph agent using everyday natural language. Below are standard query templates for immediate evaluation:

Category	Sample Query	Pipeline Behavior
Invoicing	send invoice for $50 to dhivakarsa10@hotmail.com	Generates PayPal invoice record AND dispatches real email via Google SMTP
Reporting & DAG	What was my total sales volume last month? send report to dhivakarsa10@hotmail.com	Step 1 fetches settlement report; Step 2 emails ledger breakdown to Hotmail
Math & Time	calculate 450 * 0.18 + 25.50 and what is the current time in UTC?	Evaluates calculation via AST engine and queries current UTC timestamp
RAG Docs	what are the dispute policies and fees for chargebacks?	Executes RAG semantic search across indexed PayPal developer guides
System Search	What tools are available for managing invoices?	Introspects registered system catalog and lists matching capabilities
Clarification Gate	create an invoice	Halts safely: requests missing invoice amount and recipient email

Observability Accordion & Token Accounting

Every assistant response includes an interactive expandable accordion titled **'Task Timeline (10-Stage Pipeline Observability)'**. Clicking this accordion reveals: (1) Stage-by-stage execution timestamps; (2) Scoped namespaces; (3) Bounded candidate counts; (4) Execution latency in milliseconds; and (5) Gemini token accounting (Prompt, Completion, Total).

3. Screen 2: Tools & Knowledge Sources Catalog

Navigate to **Tools & Sources** in the left navigation sidebar. This screen features two primary tabs:

- **Tab A: Registered Tool Catalog:** Displays all 60+ registered APIs grouped by domain (invoicing, payments, reporting, disputes, general). Shows HTTP method, endpoint path, risk classification, approval policy, and active/disabled toggle switch.
- **Tab B: Documents & Knowledge Sources:** Displays indexed reference guides and allows Administrators to ingest new sources.

Ingesting Local Documents (PDF, TXT, MD, CSV, JSON)

1. Open the **Documents & Knowledge Sources** tab.
2. Expand the **'■ Ingest New Source (Administrator)'** drawer.
3. Choose the **'■ Upload Local Document (PDF, TXT, MD, CSV, JSON)'** radio option.
4. Click **'Browse files'** to select your document (e.g. compliance policies, pricing tables).
5. Select the domain category and click **'■ Upload and Index Local File'**.
6. The platform extracts all text (using pypdf for PDFs), chunks the content into overlapping paragraphs, computes vector embeddings, and stores them in Qdrant.

4. Screen 3: Administrator Tool Creation Studio

Administrators can configure and register new technical tools directly from the UI without modifying source code:

1. Navigate to **Admin: Create Tool** in the sidebar.
2. Fill out the 10-section tool configuration form: Tool Name, Display Name, Service, Domain, Method, Path, Timeout, Auth Profile, and Parameter Schemas.
3. Set the **Risk Level** (READ_ONLY, INTERNAL_WRITE, EXTERNAL_WRITE, FINANCIAL, DESTRUCTIVE).
4. Click **'■ Validate Schema & Run Mock Test'** to verify tool behavior.
5. Click **'■ Register Tool into Dual-Index Catalog'** to atomically register the API into PostgreSQL and Qdrant.

5. Screen 4 & 5: Usage Analytics & Task Logs

- **Usage & Activity (Screen 4):** Normal users see their personal token metrics. Administrators access enterprise analytics: Fleet Total Tokens, Model Usage Breakdown, Active User Ledger, and Cost Estimations based on Gemini 2.5 Flash pricing ($0.075 / 1M prompt tokens).
- **Task Logs (Screen 5):** Displays immutable audit records for every executed turn. Click **'Inspect Input Arguments & Response Payload'** to inspect raw JSON payloads, latencies, and execution status.
